eP Convergence - IO.WN.Adapter Service Architecture

Overview:

This page provides overview essentially around networking aspect of following new service that will support of ep Convergence.

1. IO.WN.Adapter

Refer https://evicorehealthcare.atlassian.net/wiki/spaces/EA/pages/1789558825 `Request access` for better understanding

1. **IO.WN.Adapter-** Anti Corruption Layer between IO and WN

Purpose

1. Observe IO CaseSaved event and filter ones belonging to eP Coverged plans
2. Enrich data as required for WrittenNotification by calling IO Plugins and DB
3. Transform data into Kafka message - SendNotificationCommand - and publish on WN.Intake topic
4. Overall this service will integrate ImageOne with WrittenNotification applications

Implementation

1. This service will be built as continuously running service using .NET 6 worker template
2. It will deployed on Azure Kubernetes - AKS for effective scalability and availability

Recommendation

1. Service to be deployed in WrittenNotiication namespace on AKS
2. For Logging, ACR and Key Vault WrittenNotification One Subscription pattern as outlined below to be followed
3. Create Adapter-specific container in common storage account for storing tfstate
