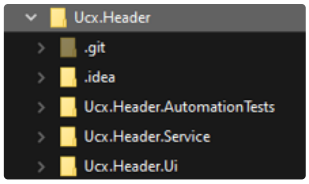
Mono Repo Pattern

1. Single root repository
   a. This helps us make it easy to find all of the code related to a given domain.
2. Solution file goes into the base directory
   a. This allows for one single solution to open all of the applicable projects, to make testing and coding easier.
3. Sub directory from main for Automation Tests, UI (react code), and Service (observer/api), and their unit tests go in these directories as well.
   a. This helps make sure the parts of the application that can be separated are still separated, and have their own pipelines and tests, making it easy to work on each part of the code.

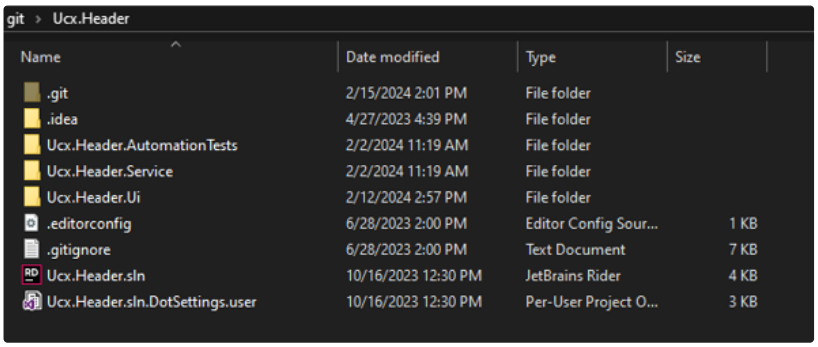
Example:

https://dev.azure.com/eviCoreDev/UCX/_git/Ucx.Header?path=%2F&version=GBmain&_a=contents

This is the top level of the header service:



The files inside of the Ucx.Header directory (note a sln file Ucx.Header.sln and no project files (.csproj)):



The files inside Ucx.Header.AutomationTests (note no files outside of this are about automation tests):

git › Ucx.Header › Ucx.Header.AutomationTests ›
