UCX - Request Search Diagrams

Business use case and implementation overview

Clinicians (MDs and Nurse) need a way to search requests created in ImageOne and eviCore Platform. (possible other source systems in future)

Information about above requests is available via kafka messages as events. Eg. RequestForServiceSubmitted, ServicingProviderUpdated.

To Solve the use case.

a) An App Service(consumer) that subscribes to said topics in Kafka and logs the events to a store (cosmos db) and event source a state to facilitate search.

b) Another App Service (API) with a staging slot uses the state created from the previous app to provide searching capabilities exposed via restful APIs, accessible via APIM.

c) Static JS files are housed in a shared RSG's SA (For UCX) which is served to the browser via Azure WAF with CDN.
