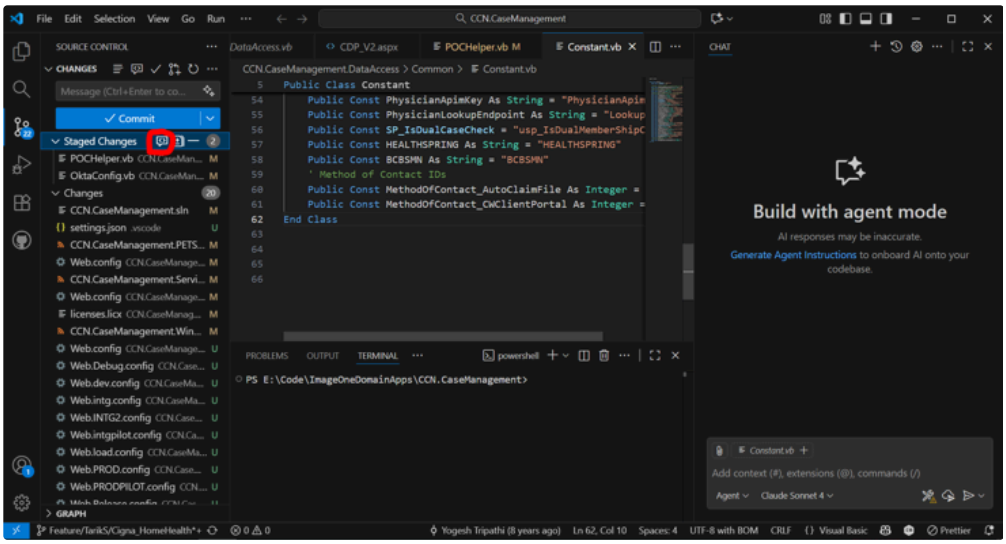
PR review using GHCP (w/o MCP server)

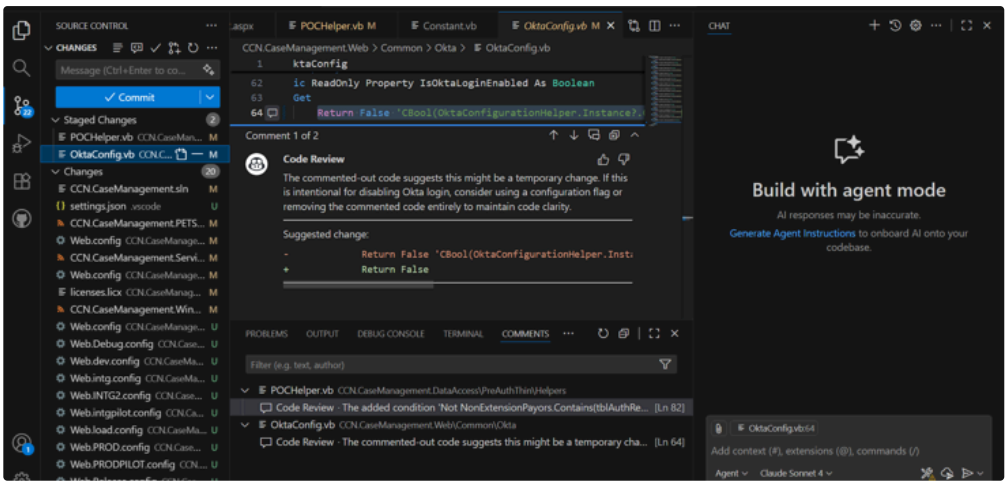
Developer Activities:

<u>During Development / Before Raising a Pull Request (PR):</u>

1. Use the **Code Review** feature in Visual Studio Code by clicking the **comment icon**, as shown in the screenshot below.



2. Above action will generate **file-level code review comments**, visible in the interface as shown in screenshot below:



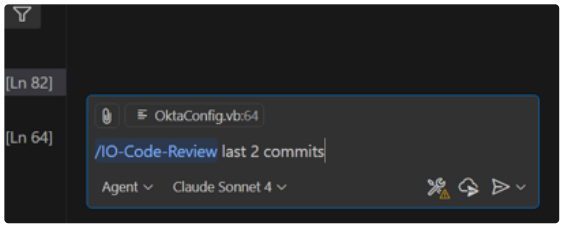
3. Review the generated comments and make necessary code changes based on the feedback.

<u>After Raising the Pull Request:</u>

1. Add the prompt file ([Code-Review-Without-MCP.prompt.md - Repos]() or `Code-Review-Without-MCP.prompt.md`) with name “IO-Code-Review.prompt.md“ in VS code using Prompt file option available in Copilot chat setting option as shown below: **This is a one-time activity per VM**

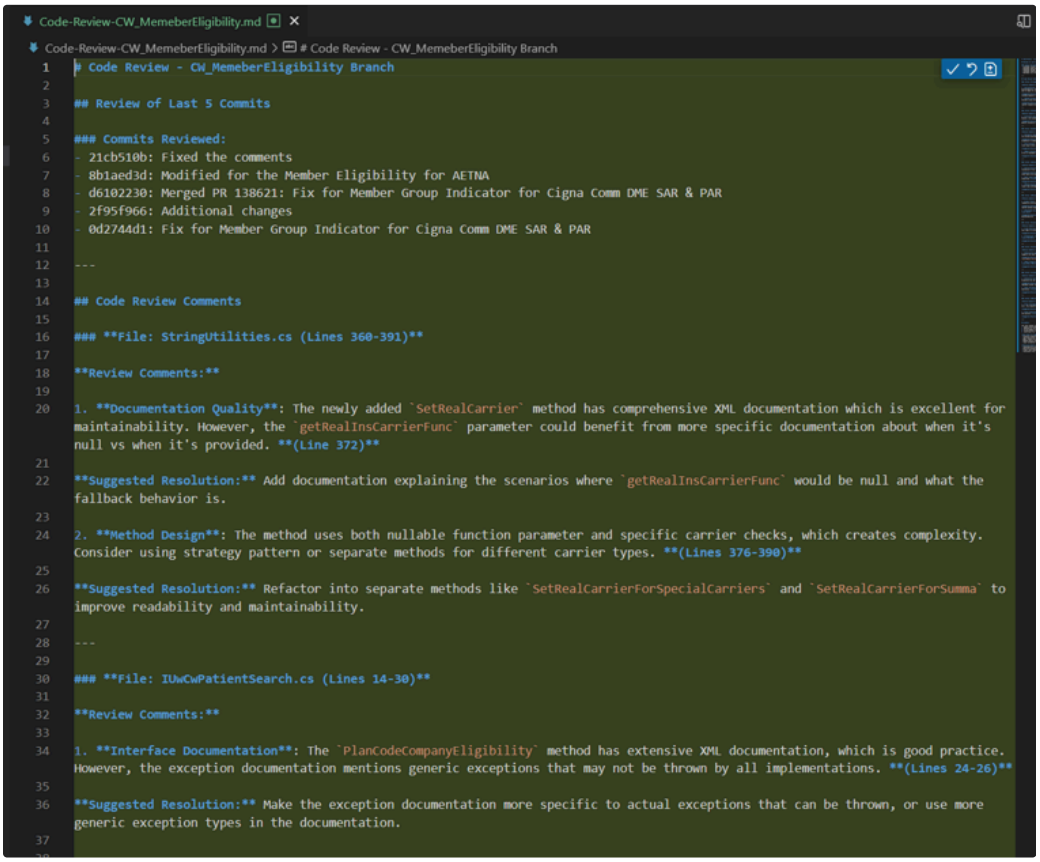
   Note: Consider “User Data” (Global folder in user machine) option while adding the prompt.md file

2. Retrieve the **feature branch name** and the **number of commits** from the Pull Request to be reviewed.
3. Map the feature branch in Visual Studio Code.
4. In Copilot chat window using Agent mode Execute the Prompt file using the command “/IO-Code-Review last n commits“ where n refers to the number of commits present in Pull request as mentioned in step 2 e.g. for Pull request with 2 commits execute command / prompt as “/IO-Code-Review last 2 commits“



5. Follow the instructions and provide inputs as guided by Copilot during prompt execution.

6. Post completion of the prompt execution, a md file named “ `Code-Review-<branch-name>.md` “ will be created with the details of the review comments generated by Github Copilot as shown below:



```
Code-Review-CW_MemeberEligibility.md
Code-Review-CW_MemeberEligibility.md > # Code Review - CW_MemeberEligibility Branch
# Code Review - CW_MemeberEligibility Branch

## Code Review Comments

### **File: StringUtilities.cs (Lines 360-391)**

**Review Comments:**

1. **Documentation Quality**: The newly added `SetRealCarrier` method has comprehensive XML documentation which is excellent for maintainability. However, the `getRealInsCarrierFunc` parameter could benefit from more specific documentation about when it's null vs when it's provided. **(Line 372)**

**Suggested Resolution:** Add documentation explaining the scenarios where `getRealInsCarrierFunc` would be null and what the fallback behavior is.

2. **Method Design**: The method uses both nullable function parameter and specific carrier checks, which creates complexity. Consider using strategy pattern or separate methods for different carrier types. **(Lines 376-390)**

**Suggested Resolution:** Refactor into separate methods like `SetRealCarrierForSpecialCarriers` and `SetRealCarrierForSumma` to improve readability and maintainability.

---

### **File: IUwCwPatientSearch.cs (Lines 14-30)**

**Review Comments:**

1. **Interface Documentation**: The `PlanCodeCompanyEligibility` method has extensive XML documentation, which is good practice. However, the exception documentation mentions generic exceptions that may not be thrown by all implementations. **(Lines 24-26)**

**Suggested Resolution:** Make the exception documentation more specific to actual exceptions that can be thrown, or use more generic exception types in the documentation.
```

7. Copy the comments from the above md file and paste it in comment section of Pull request.
8. Add resolution comments for each code review comments generated by copilot.

Reviewer / Lead Activities:

- Verify that the PR contains:
  - Review comments generated by GitHub Copilot.
  - Resolution comments added by the developer.
- For complex changes, perform a **GitHub Copilot PR review** as described in the developer section above.
- Review all comments and resolutions. If satisfied and no additional manual review comments are needed, **approve the PR**.
- Access the Re-engieneerd PR Prompt reference.
  a. [code-review.prompt.md - Repos]

b. Review the documentation for automation processes.

- Review Automation Documentation
- post_pr_comments.ps1 - Repos (Powershell)

Recommended Model Usage:

Claude Sonnet 5 or other 1x models – Best suited for handling complex UI scenarios and generating documentation.
GPT-4.1 or other 0x models – Ideal for backend service development, unit test creation, debugging, and code fixes.
